Brief Introduction

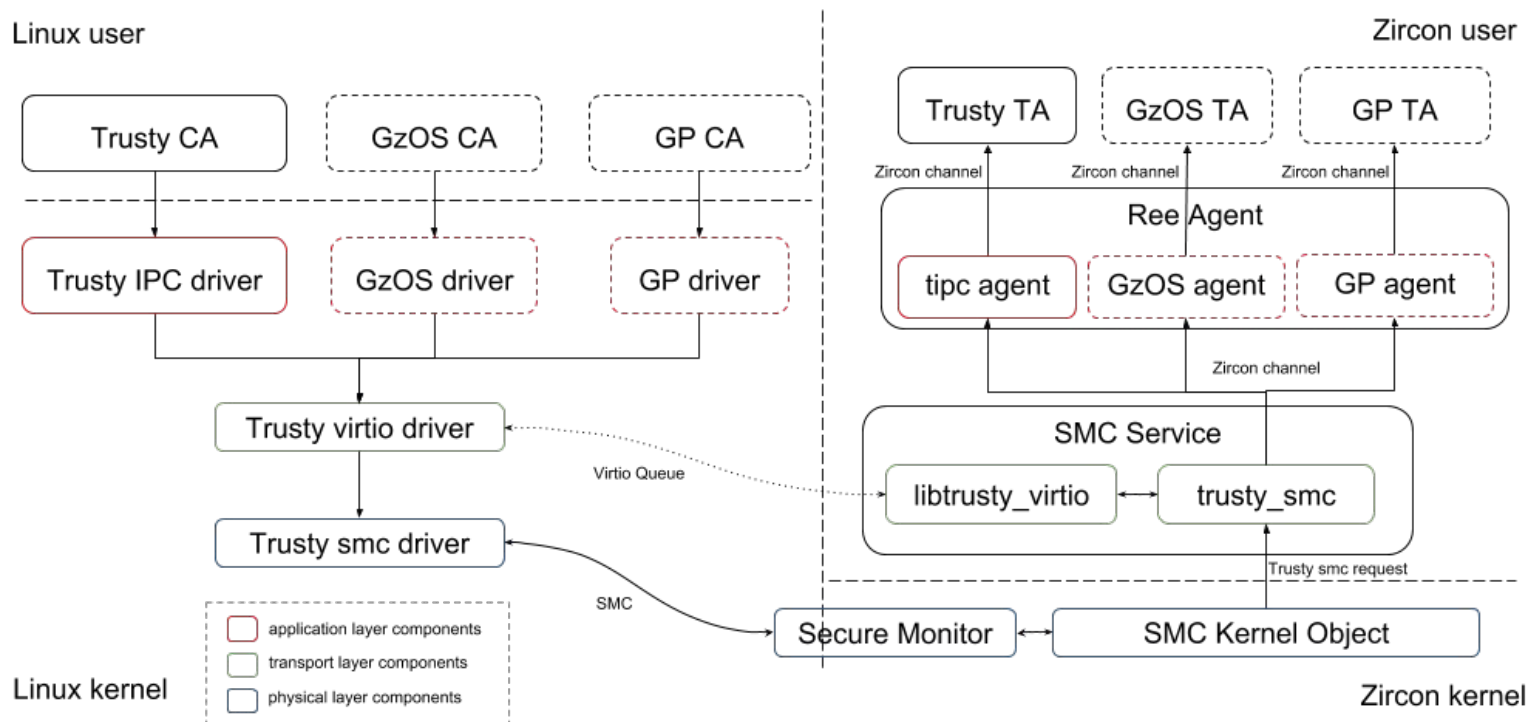

- An open-source TEE OS developed by Open Trust Group
- Licensed with MIT, BSD, Apache, ... (non-GPL license)
- Derived from [Fuchsia](#) (Garnet Layer + Zircon Core Platform)
- Supported ARMv8-A TrustZone
- Can be developed on QEMU virtual platform

Why Fuchsia?

- Microkernel architecture + Capability-based security model
- A general purpose OS but easy to be tailored for a small system
 - Note: The scale of system RAM requirement is MB, not KB
- Good software quality
- Non-GPL license

GzOS Software Architecture

GzOS Status ([ChangeLog](#))

- v0.1.0 released (2018-08-14)
 - Supported Trusty API by default
 - Supported on-demand TA loading
- v0.2.0 (under development)
 - Support GzOS proprietary API for CA to TA and TA to TA IPC
 - Support loading TA images from REE filesystem
